Geometry Notes

| Word | Illustration | Description |
| :---: | :--- | :--- |
| point |  | an exact location in space; <br> named by a capital letter |
| line |  | a straight path that extends forever in <br> opposite directions; named by two <br> points on the line |
| line |  | a part of a line with two endpoints; <br> named by the two endpoints |
| plane |  | a flat surface that extends without end <br> in all directions |
| ray |  | a part of a line with one endpoint that <br> extends forever in one direction; named <br> by the endpoint first followed by <br> another point on the ray |
| vertex |  | two rays joined at a common endpoint <br> called the vertex; named by the vertex <br> or the vertex and a point on each ray |
| antersecting |  | the point on an angle or polygon <br> tines or segments that meet or cross <br> where two lines or rays meet; named <br> with a capital letter |
| ate point |  |  |

## Geometry Notes

| Word | Illustration | Description |
| :---: | :--- | :--- |
| perpendicular |  | lines or segments that meet or <br> intersect to form right angles (or a <br> square corner) |
| parallel |  | lines or segments in a plane that stay <br> the same distance apart and never <br> meet or cross |
| horizontal |  | parallel to the horizon of the earth |
| vertical |  | perpendicular to the horizon of the <br> earth |
| diagonal |  | slanted (neither horizontal nor vertical) |
| polygon <br> arregular <br> polygon <br> from 3 or more line segments that <br> intersect at their endpoints |  |  |
| polygon polygon with sides and angles that <br> are not congruent |  |  |
| a polygon with congruent sides and |  |  |
| angles |  |  |$\quad$
